EDUCATION

George Mason University

Ph.D. in Computer Science

Fairfax, USA

Aug. 2023 - Dec. 2027 (Expected)

University of Southern California

M.S. in Computer Science

Los Angeles, USA

Aug. 2021 - May 2023

Nanjing University of Information Science & Technology

B.E. in Network Engineering

Nanjing, China

Sep. 2017 - Jun. 2021

RESEARCH STATEMENT

Research Interests: My research focuses on *motion planning, robot learning, world models, and embodied intelligence*, with an emphasis on learning from large-scale interaction data for real-world robotic systems.

Research Questions: How can robots learn *structured, transferable representations of physical interaction* that enable *generalizable prediction, planning, adaptation, and control* across diverse embodiments and environments?

RESEARCH EXPERIENCE

George Mason University

Research Assistant, [RobotiXX Lab](#)

Advisor: [Xuesu Xiao](#)

Fairfax, USA

Aug. 2025 - Present,

Summer 2024 - 2026

Verti-Bench: A General and Scalable Off-Road Mobility Benchmark

- Created a general off-road mobility benchmark *Verti-Bench* on vertically challenging terrain with 100 off-road environments and 1000 navigation tasks scalable to various vehicle types
- Incorporated millions of off-road terrain features including geometry, semantics (rigid and deformable), and obstacles
- Provided various datasets and a RL interface to facilitate data-driven off-road mobility
- Implemented ten different off-road mobility systems evaluated in the benchmark

Verti-WM: A Physics-Aided Exteroceptive World Model for Off-Road Reinforcement Learning

- Proposed a physics-aided exteroceptive world model that recurrently fuses Transformer-based and neuro-symbolic kinodynamic specialists for terrain-conditioned 6-DoF rollouts across rigid and deformable terrain
- Enabled reinforcement learning entirely within the learned world model through map-conditioned autoregressive rollouts, eliminating further access to the high-fidelity simulator during policy optimization
- Reduced prediction error by up to 34.6% and 21.7% over data-driven and physics-based baselines, while accelerating policy training by 23.6X and achieving an 80% real-world success rate

VertiAKD: Adaptive Off-Road Kinodynamics on Vertically Challenging Terrain

- Proposed a shared mobility representation that jointly encodes vehicle configurations, trajectory transitions, and local terrain features to capture kinodynamic (dis)similarity across vehicle-terrain interactions
- Designed a terrain-aware function encoder that models forward kinodynamics with neural Ordinary Differential Equation (ODE) basis functions incorporating elevation and semantic information, initialized by a coefficient prior constructed from relevant mobility descriptors in the shared latent space
- Developed an online adaptation scheme that refines the transferred coefficient prior from streaming observations using recursive least squares, without gradient-based retraining during deployment
- Reduced long-horizon prediction error by up to 34.52% over direct mobility descriptor transfer across diverse unseen vehicle configurations and 94.43% over competing baselines

VertiAdaptor: Online Kinodynamics Adaptation for Vertically Challenging Terrain

- Presented a unified terrain representation using the Sliced Wasserstein Autoencoder (SWAE) to efficiently obtain elevation and semantic embeddings beneath the vehicle

- Proposed the first $\mathbb{SE}(3)$ kinodynamics online adaptation framework based on complex off-road elevation and semantics that enables rapid kinodynamic model updates through least-squares optimization
- Improved prediction accuracy by up to 23.9% and achieved a 5X faster adaptation time compared with Multi-Layer Perceptron fine-tuning, Model-Agnostic Meta-Learning, and neural ODE

VertiSelector: Automatic Curriculum Learning (ACL) for Wheeled Mobility

- Presented the *VW-Chrono* simulator, designed for wheeled mobility on vertically challenging terrain to algorithmically generate varied vertically challenging terrain for ACL
- Proposed a novel ACL framework that samples training terrain based on estimates of future learning potential (TD-error)
- Combined Proximal Policy Optimization (PPO) with the SWAE structure to efficiently learn wheeled mobility in *VW-Chrono*
- Improved navigation performance by 23.08% in terms of success rate compared against a manually designed curriculum, vanilla RL, a hybrid (classical and learning) method and two classical baseline approaches

Boston University

Research Intern, [H2X Lab](#), Advised by *Eshed Ohn-Bar*

- Research Topics: deep visual odometry, motion estimation

Boston, USA

May 2022 - Aug. 2022

Nanjing University of Information Science & Technology

Research Assistant, Advised by *Xiaorui Zhang*

- Research Topics: domain adaptation, emotion recognition

Nanjing, China

Oct. 2019 - May 2021
